

Project Design Phase
Proposed Solution Template

Date	01 October 2026
Team ID	SWTID-2026-8273
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Incident records need consistent and accurate data for effective triage, routing and resolution. Relying only on user awareness and manual checks leads to incomplete, inconsistent or incorrect data, which hurts reporting accuracy, SLA compliance and service quality. There is a need to enforce conditional field behavior and validation directly at the user-interface level, so that field visibility, mandatory status and save-time validation are controlled through standardized UI Policies and Client Scripts before an Incident is submitted.
2.	Idea / Solution description	Use ServiceNow client-side controls to enforce data integrity on the Incident form: UI Policy & UI Policy Actions: Declarative rules that make fields mandatory, visible or read-only based on conditions (e.g., Hold Reason mandatory when State is On Hold; Resolution Code and Resolution Notes mandatory when State is Resolved). Client Scripts: onLoad scripts set defaults and auto-populate values; onChange scripts react to field changes (e.g., Category or Priority); onSubmit scripts validate the form and stop submission with an error message when business rules are not met. Each of the three team members owns one part: (1) UI Policies and Actions, (2) Client Scripts (onLoad / onChange / onSubmit), (3) test cases and validation of the Incident form.
3.	Novelty / Uniqueness	Combines no-code UI Policies with targeted Client Scripts, so scripting is used only where a policy cannot do the job, which keeps the solution simple, readable and upgrade-friendly. Gives instant feedback on the form before submission instead of after a server round-trip or a later data clean-up.

		Serves as a reusable, standardized pattern for data-quality rules rather than ad-hoc, one-off form customizations.
4.	Social Impact / Customer Satisfaction	Fewer incomplete or incorrect tickets means fewer back-and-forth clarifications, so users get faster routing and resolution and higher satisfaction. Support agents spend less time correcting data and more time resolving issues; guided forms reduce errors and training effort for new agents. Cleaner data gives managers reliable reports and better SLA compliance.
5.	Business Model (Revenue Model)	The solution is an internal platform customization and does not sell a product directly; its value comes from cost and effort savings. Savings: less rework, fewer mis-routed incidents and fewer SLA breaches. It can also be packaged as a reusable update set or offered as an implementation and consulting service for organizations and managed service providers using ServiceNow.
6.	Scalability of the Solution	Rules are condition-based and configured in the platform, so new fields, conditions or validations can be added without redesigning the solution. The same approach can be extended to other task-based tables such as Problem, Change and Service Request. It can be moved between instances (Dev, Test, Prod) through update sets and scales with growing ticket volume because the checks run in the user's browser.
