

Project Design Phase Solution Architecture

Date	01 October 2026
Team ID	SWTID-2026-8273
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Solution Architecture:

The solution enforces Incident data quality directly on the ServiceNow form. UI Policies and Client Scripts run in the user's browser and control field behavior and validation, so only complete and valid Incident records are saved to the platform.

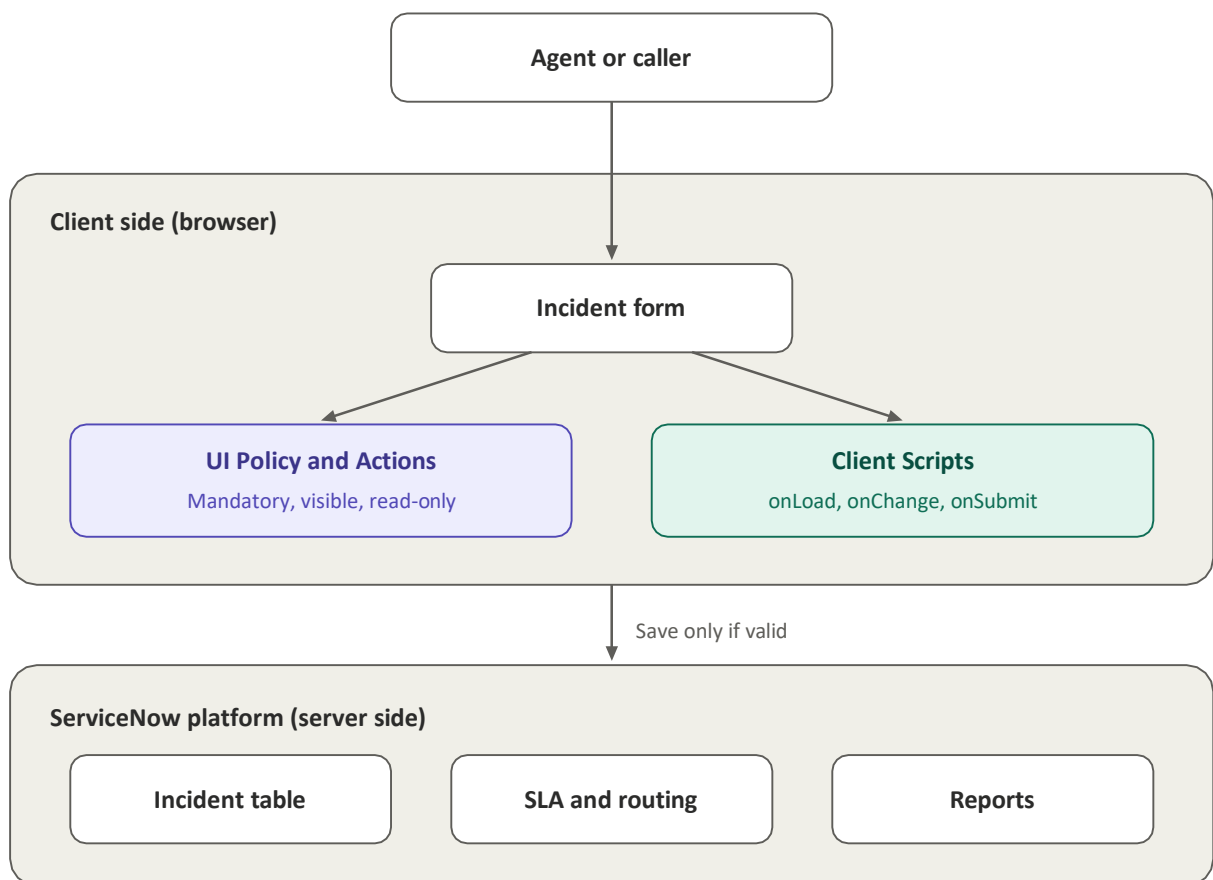

Figure 1: Solution architecture for client-side validation of Incident records

S.No.	Component	Description
1.	Agent or caller	Person who creates or updates an Incident record on the form.
2.	Incident form	ServiceNow form where the user enters data; UI Policies and Client Scripts are applied to it.
3.	UI Policy and Actions	Condition-based rules that make fields mandatory, visible or read-only (e.g., Hold Reason when State is On Hold; Resolution Code and Notes when State is Resolved).

S.No.	Component	Description
4.	Client Scripts	onLoad sets defaults and auto-populates values; onChange reacts to field changes; onSubmit validates the form and stops submission with an error message when rules are not met.
5.	Incident table	Stores only records that have passed the client-side checks.
6.	SLA and routing	Complete and accurate data enables correct assignment, triage and SLA tracking.
7.	Reports	Consistent data gives reliable reporting and better service quality.
