

PROJECT DESIGN PHASE-II

Customer Journey Map

	Date		01 October 2026	
	Team ID		SWTID-2026-8273	
Project Name			Implement Client Script & UI Policy (Incident)	

Primary persona: Service Desk Agent / Incident User. Scenario: Creating, validating, submitting, and updating an Incident record in ServiceNow.

Step	Interactions	Things / Touchpoints	Goals & Motivations	Positive moments	Negative moments	Areas of opportunity
1. Open Incident form	Open ServiceNow and navigate to Incident creation.	ServiceNow application / Incident module	Access the correct Incident form	Clear starting point	Difficulty locating the correct module	Provide clear Incident navigation
2. Enter basic details	Enter short description, description and initial Incident information.	Incident form fields	Complete initial Incident data	Easy entry of basic details	Uncertainty about which fields are required	Use UI Policies to guide required fields
3. Select / modify values	Select Category, Impact, Urgency and other relevant Incident values.	Incident form / dropdowns	Provide accurate classification and priority data	Dynamic field behavior helps the user	Conditional requirements may be unclear	Use UI Policies and onChange Client Scripts
4. Review & validate	Review the form before saving.	Incident form / validation messages	Ensure information is complete and valid	Immediate feedback reduces mistakes	Missing or inconsistent information can delay submission	Use onSubmit Client Script validation
5. Submit Incident	Click Submit and create the Incident record.	Submit action / ServiceNow Incident table	Create a valid Incident record	Successful submission with complete data	Invalid records should not be submitted	Prevent submission when rules are not met
6. Triage / routing	Incident is reviewed, assigned and processed.	Incident record / assignment fields	Support effective triage and routing	Accurate data supports downstream work	Incorrect data can affect routing and reporting	Maintain consistent client-side data entry
7. Update / resolve	Authorized users update the Incident through its lifecycle.	Incident record	Keep Incident information accurate	Consistent updates improve service quality	Changes may make fields incomplete or inconsistent	Apply appropriate UI Policies during updates

Overall Journey Insight

The user needs the Incident form to guide data entry at the moment it matters, dynamically apply defined field rules, and stop incomplete or invalid submissions before they become Incident records.
